

Proposal for Family Monitoring Application

1. What This App Will Do

We will build an app that works on both mobile phones and computers. Parents will install the app on their device, and children will install it on theirs. Parents will be able to see what their children are doing live (in real-time) and also review past activities. Families with many children (4, 6, 8, or more) can monitor all children at the same time or one by one. This app will work whether the family is in the same house or in different countries.

2. The Problem

In today's world, children are often exposed to harmful online content at a very young age. Many children become addicted to adult material or unsafe websites. Some get involved in so-called "love" or relationships that are not healthy and go against many religious and cultural values. Parents usually don't know what their children are doing online, especially when children use devices in private. This can affect children's mental health, studies, discipline, and moral values. Because of this, parents need a safe way to monitor and guide their children, while also protecting religious and cultural values.

3. Key Features

For Parents:

- Connect Child Devices – Add one or many children's devices to your account.
- Live Screen View – See what children are doing live.
- History View – Check saved past screen activities.
- Multi-Child Support – Watch all or specific children at once.
- Notifications – Get alerts for unusual or restricted activity.
- Cross-Platform – Works on phones and computers.

For Children's Devices:

- Runs in Background – Works silently with permissions.
- Shares Screen Live – Sends live screen to parent device.
- Saves Activity – Keeps a record of what was done for history view.
- Secure Connection – Only linked parents can see the child's screen.

4. How It Will Work (Technology)

The app will have two parts:

1. Apps for parents and children (phones + computers)
2. A server (cloud system) that connects them and saves past history.

5. Security & Privacy

- Only parents with permission can see their children's devices.

- All data will be encrypted (kept private and secure).
- Parents and children will connect through a pairing system (like entering a code).

6. Challenges to Keep in Mind

- On iPhones, Apple does not allow apps to always record the screen in the background.
- On Android and computers, it's easier to run in the background.

- Streaming live video will use more battery and internet, so optimization will be needed.

7. Skills & Tools Needed

- Flutter (or React Native + Electron) for the apps.
- Firebase or custom server for storage, login, and syncing.
- WebSockets or WebRTC for live screen sharing.
- Cloud storage (Google Cloud, AWS, or Firebase) for saving history.
- Security & encryption to protect family data.

8. Cost & Timeline Estimate

Stage	Work Included	Timeline	Estimated Cost
1. Planning & Design	Finalize features, app flow, simple UI design	2 weeks	\$1,000 – \$1,200
2. MVP (Basic Version)	Parent connects 1 child, live screen monitoring only	4 – 5 weeks	\$2,500 – \$3,000
3. Full Features	Add history logs, multi-child support, notifications	5 – 6 weeks	\$3,000 – \$3,500
4. Testing & Fixes	Bug fixing, optimization, cross-platform testing	2 weeks	\$1,200 – \$1,500
5. Launch & Support	Publish to stores + basic support	2 weeks	\$800 – \$1,000

- Total Timeline: Around 3 to 4 months
- Total Cost Range: Around \$9,500 – \$10,200

9. Next Steps

1. Decide whether to build in Flutter (recommended) or React/Electron.
 2. Approve the budget and timeline.
 3. Start with a Minimum Viable Product (MVP) where one parent monitors one child live.
 4. Expand into the full version with all advanced features.
- With this system, parents will have a safe, simple, and powerful way to monitor their children on any device, anywhere in the world — protecting them from harmful content and guiding them towards a healthier life while preserving family, cultural, and religious values.
